

# Running JoinMarket on the RaspiBlitz

**RASPI ⚡ BLITZ**

# What is JoinMarket?

- A long standing **coinjoin** implementation with **decentralised coordination** and incentive structure.
- It makes the **Takers** able to pay others to coinjoin with them
- The **Makers** can earn bitcoin by offering funds to coinjoin with

**Code:** <https://github.com/JoinMarket-Org/joinmarket-clientserver>

- 26 contributors since Nov 20, 2016 (started in 2015)
- Programming language: Python3

## Stack:

- Bitcoin Full node RPC
- JoinMarket CLI / JoininBox menu
- JoinMarketQT GUI showing on the desktop

# CoinJoin implementation

## Pool size

- Variable. Any amount can be coinjoined within the Offer Book limits (produced by the Makers)

## Fees

- Maker Fees: random offers are chosen between preset limits from the Offer Book
- Miner fees: variable, paid by the taker (sat/byte randomised around the coordinator/taker setting)  
There is a variable and randomised contribution to onchain fees by the makers (taken from the maker fees)

## Architecture (with default settings)

- Coordination is decentralised, P2P through encrypted IRC
- Running behind Tor
- CJ participants are arbitrary or randomised between 7-9
- Wallets are separated to 5 accounts (mixdepths)
- The UTXOs only progresses between mixdepths as a result of a CJ (the unmixed change is left behind in the same mixdepth) - avoids merging unmixed change automatically
- Can only spend from one mixdepth at a time (no consolidation between accounts) - unmixed change is forced to keep separate

# Features

- **Coin-control** in both CLI or the GUI
- **Autolabeling** to:
  - **new / deposit**
  - **change-out** (unmixed from the last CJ),
  - **non-cj-change** (change of a non-CJ txn),
  - **reused** (more than one UTXO/txn on the same address)
  - **cj-out**
- **Pay with a coinjoin**: can be any arbitrary amount within the Offer Book limits
- **Tumbler**: multiple coinjoins to multiple addresses (including sweep transactions without change)
- **Payjoin** (aka P2EP)
  - between Joinmarket wallets
  - cross implementation (BIP 78) support compatible with BTCPayServer and WasabiWallet

# Installation on the RaspiBlitz (since v1.5)

- one click option from the SERVICE menu or [\\$ config/scripts/bonus.joinmarket.sh](#)
- building from the source code
- separated to a dedicated user: **joinmarket**

```
admin@raspberrypi:~ $ sudo config/scripts/bonus.joinmarket.sh on
*** INSTALL JOINMARKET ***
OK, running behind Tor.
Multiwallet is active and wallet.dat is used.
The bitcoin core wallet is already on
*** Cleaning before install ***
*** Add the 'joinmarket' user ***
Adding user `joinmarket' ...
Adding new group `joinmarket' (1005) ...
Adding new user `joinmarket' (1005) with group `joinmarket' ...
Creating home directory `/home/joinmarket' ...
Copying files from `/etc/skel' ...
*** setting PASSWORD_B as the password for the 'joinmarket' user ***
Adding user `joinmarket' to group `sudo' ...
Adding user joinmarket to group sudo
Done.
joinmarket ALL=(ALL) NOPASSWD:ALL
Specified to use wallet.dat in the recovered joinmarket.cfg
Reading package lists... Done
Building dependency tree
Reading state information... Done
libjpeg-dev is already the newest version (1:1.5.2-2).
```

# Installation on the RaspiBlitz - details

- Settings and wallets are preserved on the disk between updates in **/mnt/hdd/app-data/.joinmarket**
- installs ARM specific dependencies which allows opening the Joinmarket-Qt GUI on the desktop from the RaspiBlitz
- info menu with link to a [usage guide](#)

Webinterface: <http://192.168.3.161:3000>

Choose one of the following options:

RTL	RTL Web Node Manager
BTCPAY	BTCPay Server Info
ELECTRS	Electrum Rust Server
EXPLORE	BTC RPC Explorer
LNBITS	LNbits Server
LNDMANAGE	LND Manage Script
LOOP	Loop In/Out Service
SPECTER	Cryptoadvance Specter
<b>MARKET</b>	<b>JoinMarket</b>
FARADAY	Faraday Channel Management

# Using the JoinMarket-Qt GUI

- Generate and open wallets
- Coin-control - freeze any UTXO
- Send payments with or without a CoinJoin
- Tumbler: run multiple coinjoins to multiple external addresses
- Running the Yield Generator (Maker) is not yet available
- Detailed documentation on GitHub:  
<https://github.com/JoinMarket-Org/joinmarket-clientserver/blob/master/docs/JOINMARKET-Qt-GUIDE.md>
- Video demonstration by Adam Gibson (waxwing):  
<https://youtu.be/hwmvZVQ4C4M>

# JoininBox - wallet management

Copying over LAN

```
*****
Instructions to COPY wallets from another computer
*****
```

You can use the wallets from another JoinMarket instance

Both computers (the RaspiBlitz and the source computer with the wallet(s)) need to be connected to the same local network.

Open a terminal connected to the source computer and change into the directory containing the wallets.

By default the path is: '~/.joinmarket/wallets' or in older versions: '~/.joinmarket-clientserver/scripts/wallets'

You should see files called '.jmdat'

COPY, PASTE & EXECUTE the following command in the terminal of the source computer:

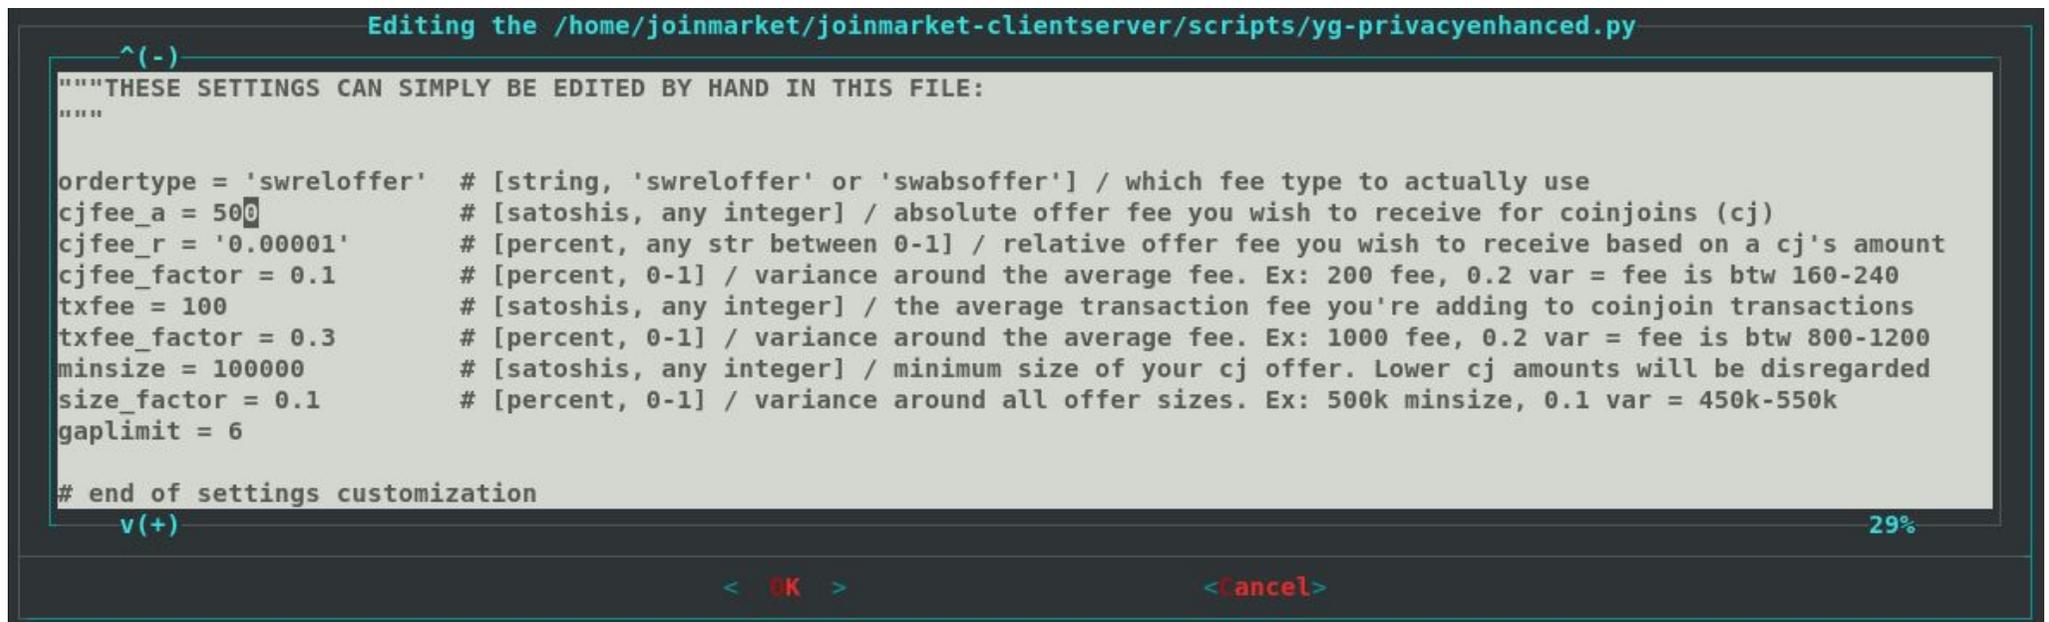

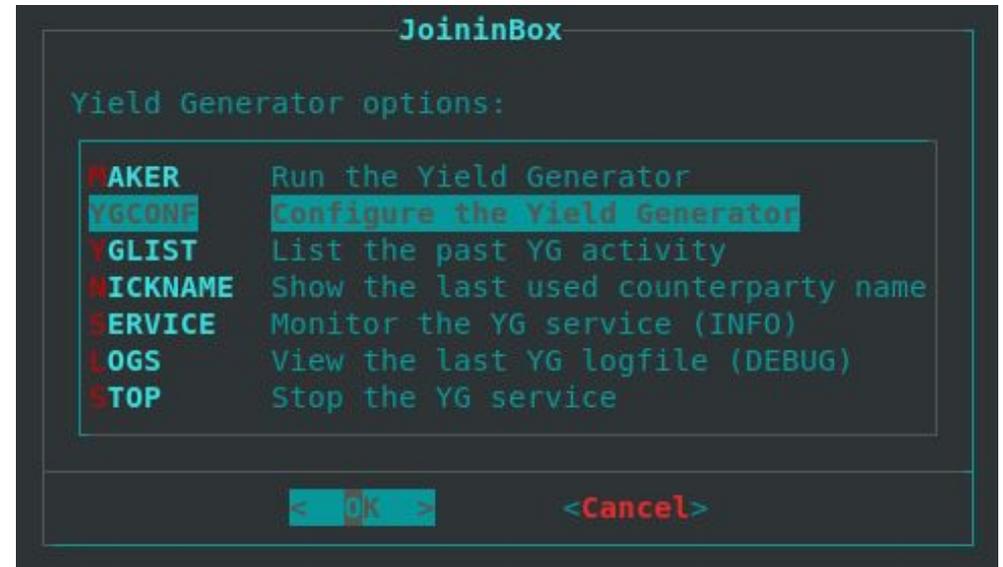

```
scp *.*.jmdat joinmarket@192.168.3.3:~/.joinmarket/wallets
```

Use the PASSWORD\_B to authorize the file transfer (same as the rpcpassword in the /mnt/hdd/bitcoin/bitcoin.conf).

```
*****
PRESS ENTER if the transfer is done OR if you want to choose another option.
```

# JoininBox

## Configure the Yield Generator

### JoininBox

Yield Generator options:

<b>MAKER</b>	<b>Run the Yield Generator</b>
<b>YGCONF</b>	Configure the Yield Generator
<b>YGLIST</b>	List the past YG activity

Running the command:

```
python sendpayment.py -m 1 -N 9 test.jmdat 10500 2NA9n45Kkin5aYNQeiBQ3PzioMRqY2DmrrP
```

User data location: /home/joinmarket/.joinmarket/

2020-08-18 16:13:44,416 [INFO] Using tx fee: 1000 sat/vkB (1.0 sat/vB)

Joinmarket will choose market makers randomly as long as their fees are below a certain maximum value, or fraction. The suggested maximums are:

X = 0.001

Y = 5090 satoshis

Those values were chosen randomly for you (unless you already set one of them in your joinmarket.cfg or via a CLI option).

Since you are using N counterparties, if you agree to these values, your **maximum** coinjoin fee will be either N\*Y satoshis or N\*X percent of your coinjoin amount, depending on which is larger. The actual fee is likely to be significantly less; perhaps half that amount, depending on which counterparties are selected.

If you want to keep this relative limit, enter 'y';  
otherwise choose your own fraction (between 1 and 0): █

Running the command:

```
python sendpayment.py -m 1 -N 9 test.jmdat 10500 2NA9n45Kkin5aYNQeiBQ3PzioMRqY2DmrrP
```

User data location: /home/joinmarket/.joinmarket/

Just bought a virtual Green Tea from @MrKukks on [demo.payjoin.kukks.org/apps/eFtHvBGQA...](https://demo.payjoin.kukks.org/apps/eFtHvBGQA...) with a #PayJoin from a bech32 @joinmarket wallet on the #Bitcoin ₿ Testnet. It is beautiful seeing these different implementations working together. [blockstream.info/testnet/tx/d57...](https://blockstream.info/testnet/tx/d57...)

To open JoininBox menu use: menu  
To exit to the Raspiblitz menu use: exit  
  
(jmvENV) joinmarket@raspberrypi:~ $ █
```

# Good coinjoin practice - recommendations

- Sweep individual UTXOs and mixdepths occasionally
- use the Tumbler script (first and last txns are sweeping - no unmixed change)
- Alternate being a Taker (tumbler, sendpayment) and Maker (yield gen)
- Break down large amounts between multiple wallets (watch the offerbook)
- Use PayJoin with merchants
